

“Dynamics and function of the NF-kappaB signalling system: How mathematical modelling can assist experimental biology”

COMBINE 2011
mike.white@manchester.ac.uk

Prof. M. White
Faculty of Life Sciences
University of Manchester

Nicolas Le Novere

- “Throughout the last decade, your work on NF- κ B has been a shining example of interplay between modelling and experiment. We would be delighted if you were willing to spend some time with us and provide a lecture on the topic of your choice (as far as it involves modelling, for the audience, and signalling for my own enjoyment”

Is molecular biology yet a science?

The great successes of the past few years suggest that living processes consist of well-ordered events executed under strict control, but a few numbers would give a different and more fuzzy impression.

There is now an army of people called molecular biologists whose published papers are innocent of references to whole plants and animals and which may have little to say about their physiology either. For these people, experimental data may consist largely of what are called, in the trade, 'gels' — perhaps simply strips of filter paper allowing the comparison of the molecular weights of large molecules with those of similar materials by the relative rate at which they move under the influence of an electric field. Such techniques are deliciously simple, at least in skilled hands. It is marvellous that so much continues to be learned from them.

J. Maddox, Nature 1992

Systems Biology

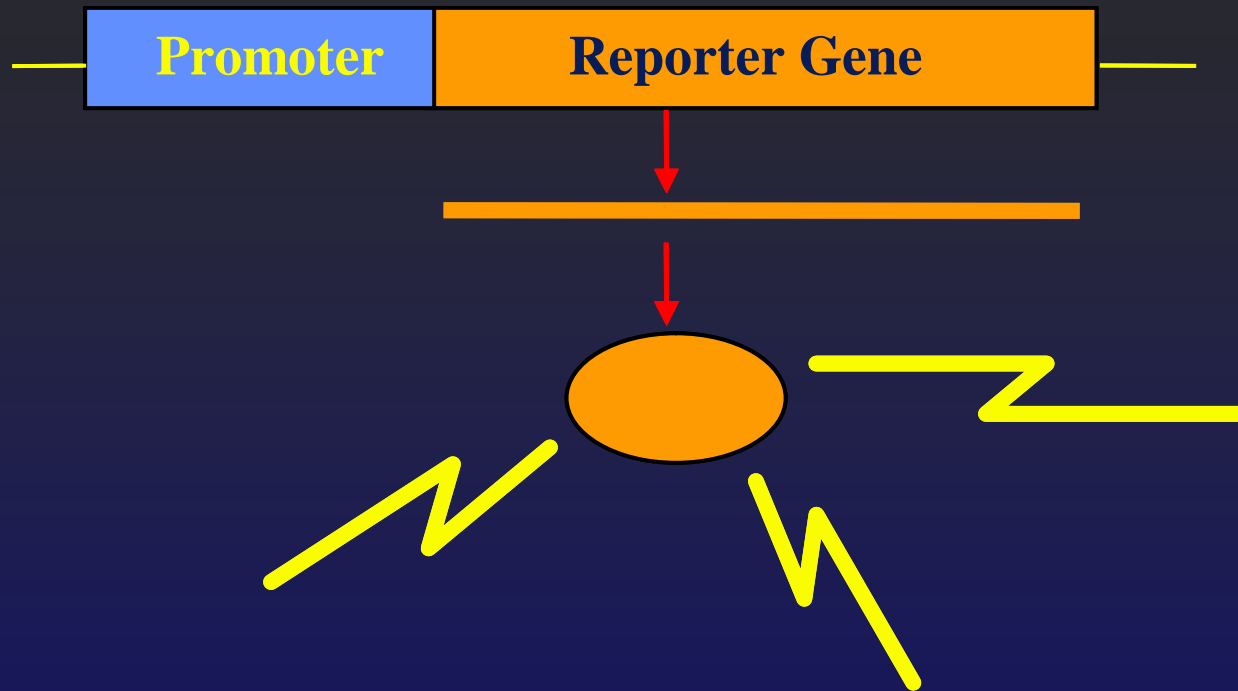

- **BBSRC**
- *“... seeks to understand the workings of biological systems as a whole, placing a greater emphasis on the interactions between components, and the consequences of such interactions, than on the components themselves (which, in a post-genomic era, are largely known).”*

Semi-quantitative Western blot analysis of I κ B α , p-I κ B α and p-RelA/p65 levels

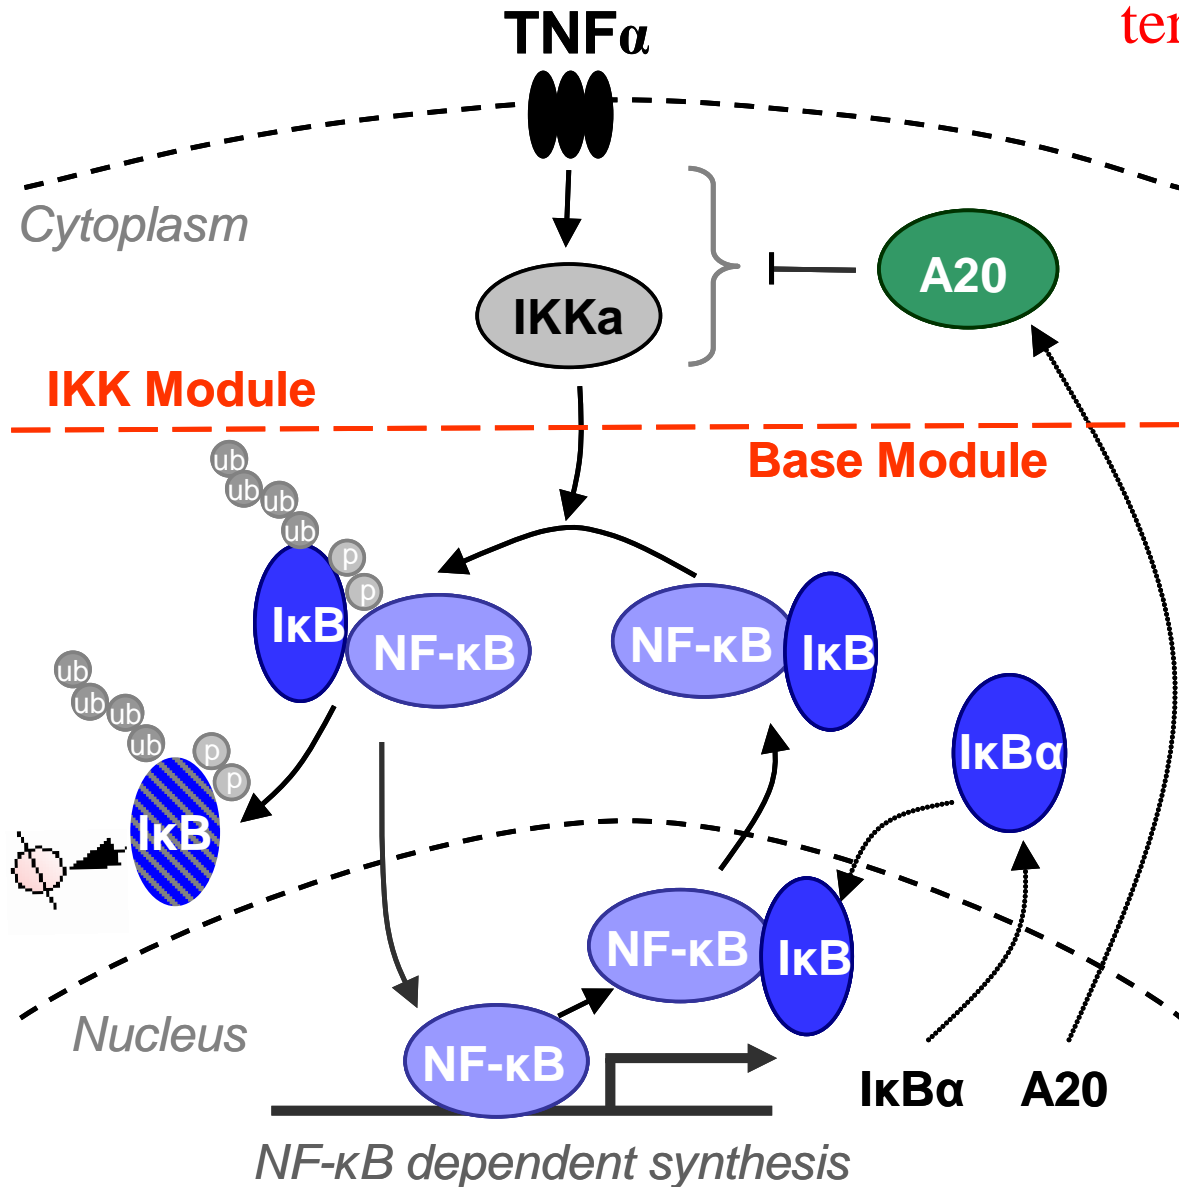

An experimental model for dynamic cell to cell cytokine signalling

Can repetitive pulsing be used to synchronise populations of cells?

**SK-N-AS
Cells**

A20^{-/-} mice fail to
terminate inflammation

Modifications with minimal assumptions to the model yielded a successful variant

Green = good fit defined by formal criteria from experimental data

A single parameter set could then simulate all experimental outputs with a reasonable fit

Differential gene expression

- Stimulation frequency determines differential gene expression.

NF- κ B dynamics

- What is the effect of stimulation dose on the responsiveness of the system?

Low dose data

■ Decreasing TNF α dose

- Reduction in amplitude
- Increase in heterogeneity (timing)

D. Turner *et al.*, *J. Cell Sci.* 123: 2834-2843
See also: Tay *et al.*, *Nature* 466: 267

Original model structure

- TNF α required for A20 inhibition

- Can fit repeat pulse data
- Reducing the dose (parameter *TR*) fails to maintain oscillations

Modification of model structure

- Remove dependence of A20 inhibition on $TNF\alpha$ stimulation

- ☐ Can still fit repeat pulse data
- ☐ Reducing the dose (parameter TR) allows maintenance of oscillations to much lower doses

- Removal of dependence of A20 inhibition on $\text{TNF}\alpha$ stimulation
 - Shift of Bifurcation point to lower TR
 - Stable oscillations can be maintained for lower doses

NF- κ B dynamics

- What is the source of cell to cell heterogeneity?

Cells like to be different!

NF- κ B Pathway: I κ B ϵ negative feedback

J. Cell Biol. **173**: 659

Mechanism of delayed I κ B ϵ transcription

A. RT-PCR

C. ChIP

Knockdown of $\text{I}\kappa\text{B}\epsilon$ expression does not affect oscillation amplitude or period in response to $\text{TNF}\alpha$

The $\text{I}\kappa\text{B}\epsilon$ feedback loop generates noise creating phase differences in different cells

A counter-intuitive prediction: The $\text{I}\kappa\text{B}\epsilon$ feedback loop has optimised delay timing for the generation of maximal cell to cell heterogeneity

Simulated effect of the $\text{I}\kappa\text{B}\epsilon$ feedback loop on population-level fluctuations in $\text{TNF}\alpha$ expression.

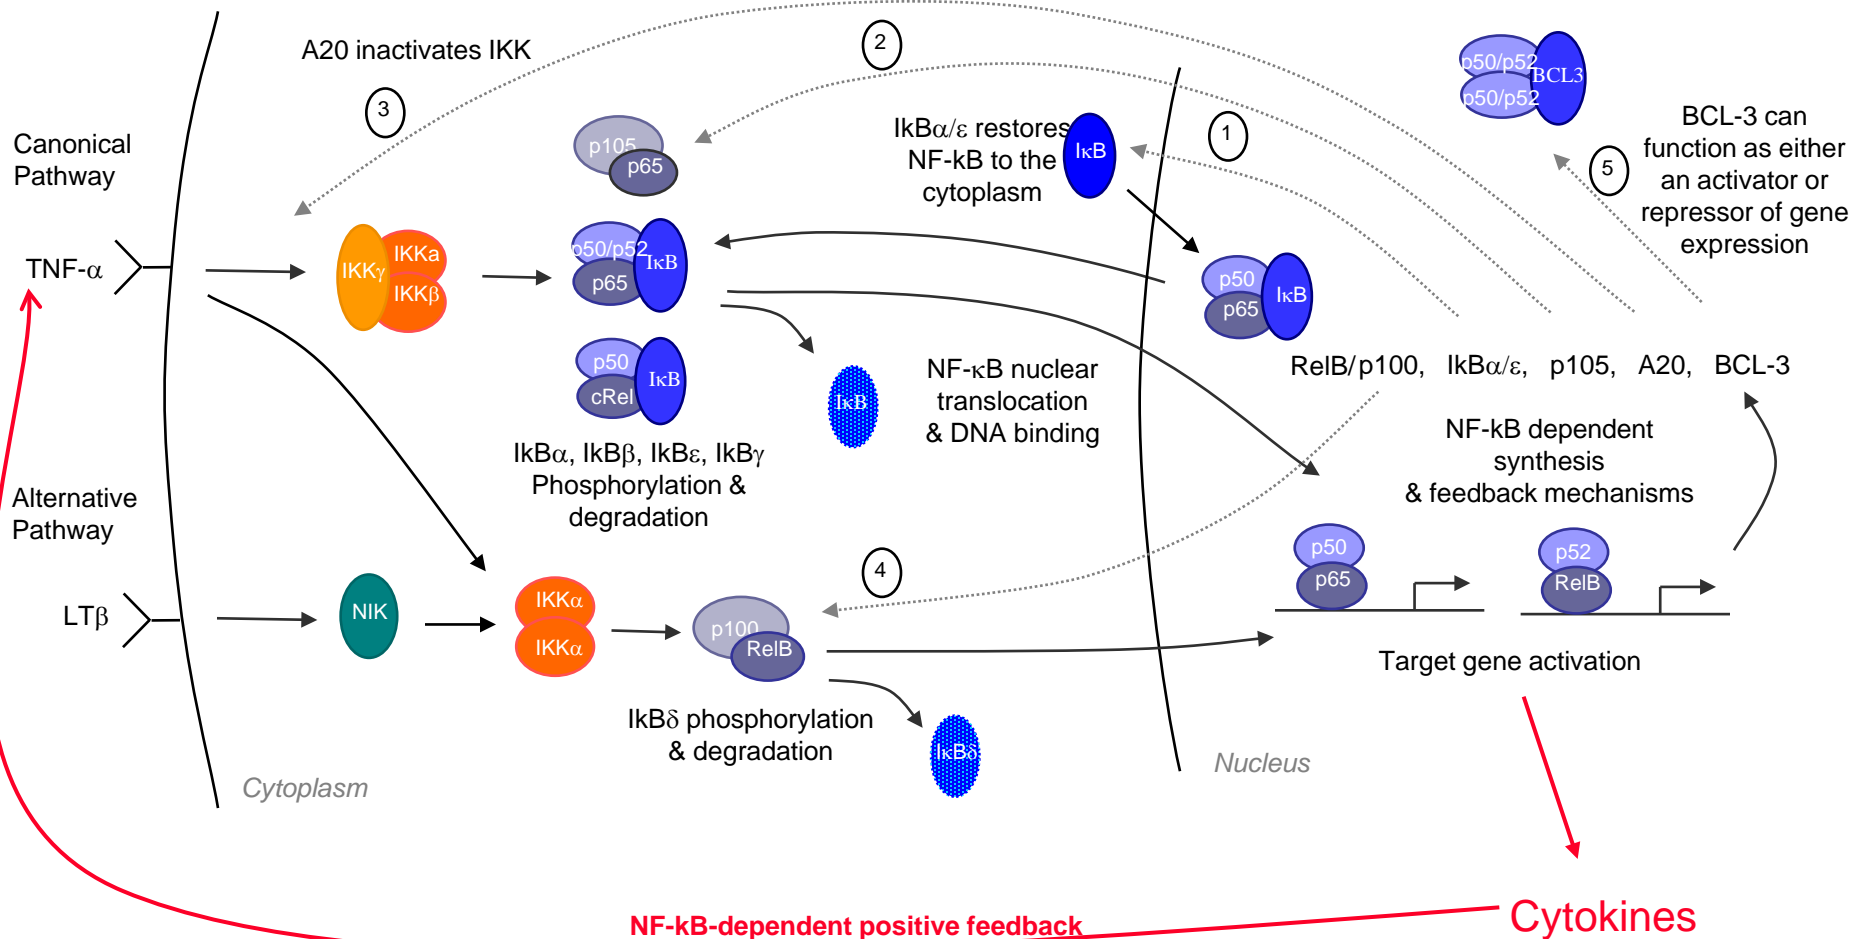

Engineered heterogeneity - hypotheses

- Cells use oscillations to accurately control gene expression
- $\text{TNF}\alpha$ is controlled by $\text{NF-}\kappa\text{B}$ and may be secreted in pulses with each oscillation.
- If cells are synchronous, then the single cell oscillations could lead to fluctuations in $\text{TNF}\alpha$ concentration.
- Tissue level fluctuations in $\text{TNF}\alpha$ could be dangerous due to positive feedback

NF-κB as a complex timing system:

NF-κB Family Members & Additional Feedback Loops

Activating Stimuli Dimer Pairs & Exchange Feedback Regulation Combined Functional Response

Complexity

- Canonical vs alternative pathway
- NF- κ B modifications
- Dimerisation and protein interactions
- Signal dependent I κ B processing

Oscillatory Systems

- Calcium -s/mins (many pubs - Dolmetsch *et al.*, *Nature*, 1997)
- MSN2 ~6 min (Jacquet *et al.*)
- ERK ~15 min (Shankaran *et al.*, *Mol. Sys. Biol.* 2009)
- Transcription cycles ~ 10s of min (e.g. Metivier, *et al.*, *Cell* 2003)
- NF-κB ~100 min (Nelson *et al.*, *Science* 2004)
- N-FAT / Crz1 mins/random (Cai *et al.*, *Nature* 2008)
- Segmentation (Notch/Wnt/FGF ~100 min (Palmeirim, *et al.*, *Cell* 1997)
- STATs ~2h (Yoshiura *et al.*, *PNAS*, 2007)
- p53 ~5-6 h (Lahav, *et al.*, *Nature Genetics* 2004)
- Cell cycle/E2F ~18 h E2F/NF-κB cross-talk
- Circadian Rhythms 1 day
- Seasonal Rhythms months/year

Coupled oscillators

- Driven oscillators – e.g. TNF α pulsing
- Gated oscillators = One oscillation permits the other only during a particular phase - (NF- κ B-E2F1)
- Loosely coupled oscillators- Mathematics predicts non-linear and unexpected effects on timing.

Working Across Biological scales

–Length scales and time scales

1 m

0.10 m

100 μ m

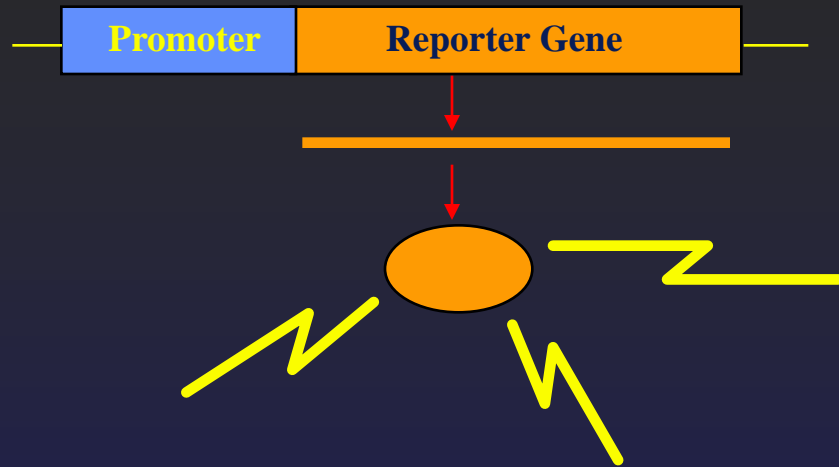

5 nm

Organism – organ – cell - molecule

Gene Expression

- Gene inactive – wrapped in chromatin
- Transcription factor binds to specific DNA sequence close to the gene.
- Accessory factors form transcription complex
- RNA polymerase binds and begins to move along the DNA making RNA
